Exercise 2

- What is Django-crispy-forms?

Django-crispy-forms is an application that can let people manage the Django forms. Also, it makes users more convenient. We can use it to improve or change Django forms' properties, and we do not need to re-write code in Django.

- How does it change or enhance the standard forms capability available in Django?

Django-crispy-forms provide the `|crispy` filter and `{% crispy %}` tag, so users can use these two functions to control Django more efficiently, and we do not need to change the content in the template. Also, it can allow the user to use other applications when using Django-crispy-forms.

- What further coding and/or configuration is required to use Django-crispy-forms?

`|crispy` filter and `{% crispy %}` tag are the only coding we need to learn, which can help users control form attributes. Some classes, such as `super`, `FormHelper`, and `Submit`.

- Are you interested in using Django-crispy-forms in your Final Project? Why? Or, why not?

I would say I am interested in using Django-crispy-forms. I think it is a very convenient application, and it is not hard to learn. Also, it can help me save my time to do other stuff. However, learning some new coding or configuration may take some time.
